COURSE TITLE: SYSTEM ANALYSIS AND DESIGN

PAPER CODE: CSE 4205

LECTURER: MASESE CHUMA

TOPIC: SYSTEM DEVELOPMENT LIFE CYCLE

CHAPTER: TWO

#### **Objective**

By the end of this session, students will be able to:

- 1. To study the phase of system development life cycle (SDLC)
- 2. To understand the attributes of system analyst and its roles

#### **OUTLINE**

- 1.0 introduction
- 2.0 Phases of system development life cycle (SDLC)
- 3.0 Life Cycle of System Analysis and Design
- 4.0 Attributes of a Systems Analyst
- **5.0** Role of System Analyst

#### Introduction

- An effective System Development Life Cycle (SDLC) should result in a high-quality system that meets customer expectations, reaches completion within time and cost evaluations, and works effectively and efficiently in the current and planned Information Technology infrastructure.
- System life cycle is an organizational process of developing and maintaining systems. It helps in establishing a system project plan, because it gives overall list of processes and sub-processes required for developing a system.
- System development life cycle means combination of various activities.
- In other words, we can say that various activities put together are referred as system development life cycle. In the System Analysis and Design terminology, the system development life cycle also means software development life cycle.
- System Development Life Cycle (SDLC) is a conceptual model which includes

policies and procedures for developing or altering systems throughout their life cycles.

•	SDLC is used by	r analysts 1	to develop	an info	ormation	system.	SDLC	includes	the
	following activitie	es:	_			-			

requirements

design

☐ implementation

testing

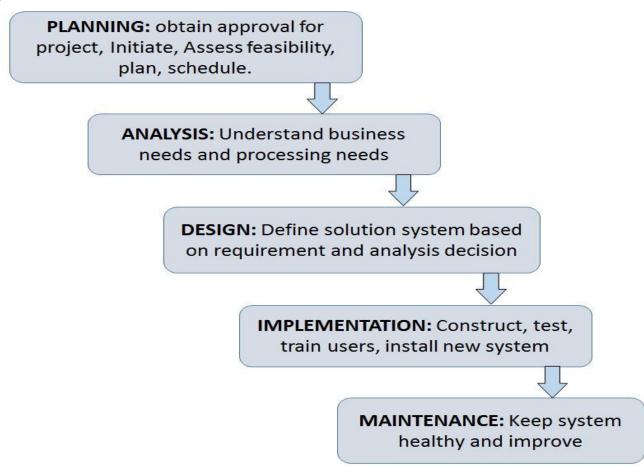

deployment

operations

maintenance

## **Phases of SDLC**

Systems Development Life Cycle is a systematic approach which explicitly breaks down the work into phases that are required to implement either new or modified Information System.

# The System Development Life Cycle

# What are the phases of the system development cycle? Phase 2. Analysis Conduct preliminary investigation Phase 1. Planning Perform detailed analysis activities: Phase 3. Design · Review project requests Study current system Acquire hardware Prioritize project Determine user requirements and software, if requests Recommend solution necessary Allocate resources Develop details of · Identify project system development team Phase 4. Implementation Phase 5. Support · Develop programs, if necessary Conduct post-implementation · Install and test new system system review Identify errors and enhancements Train users Monitor system performance Convert to new system

# Feasibility Study or Planning

Define the problem and scope of existing system.
Overview the new system and determine its objectives.
Confirm project feasibility and produce the project Schedule.
During this phase, threats, constraints, integration and security of system are also considered.
A feasibility report for the entire project is created at the end of this phase.

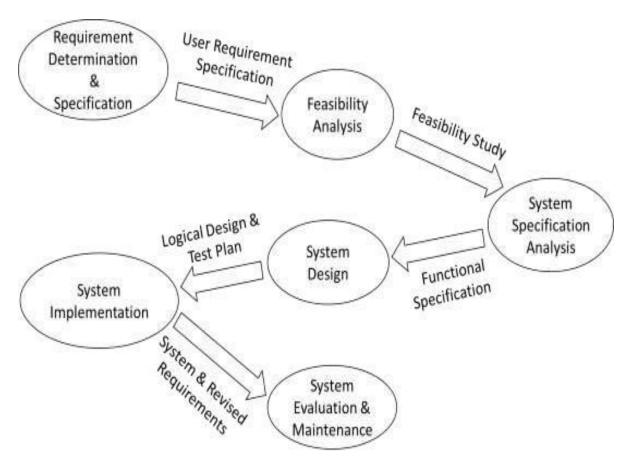

# **Analysis and Specification**

Gather, analyze, and validate the information.
Define the requirements and prototypes for new system.
Evaluate the alternatives and prioritize the requirements

	Examine the information needs of end-user and enhances the system goal. A Software Requirement Specification (SRS) document, which specifies the software, hardware, functional, and network requirements of the system is prepared at the end of this phase.				
Syste	em Design				
	Includes the design of application, network, databases, user interfaces, and system interfaces.				
	Transform the SRS document into logical structure, which contains detailed and complete set of specifications that can be implemented in a programming language.				
	Create a contingency, training, maintenance, and operation plan.				
	Review the proposed design. Ensure that the final design must meet the requirements stated in SRS document.				
	Finally, prepare a design document which will be used during next phases.				
Imple	ementation				
	Implement the design into source code through coding.				
	Combine all the modules together into training environment that detects errors and defects.				
	A test report which contains errors is prepared through test plan that includes test related tasks such as test case generation, testing criteria, and resource allocation for testing.				
	Integrate the information system into its environment and install the new system.				
Maintenance/Support					
	Include all the activities such as phone support or physical on-site support for users that is required once the system is installing.				
	Implement the changes that software might undergo over a period of time, or implement any new requirements after the software is deployed at the customer location.				
	It also includes handling the residual errors and resolve any issues that may exist in the system even after the testing phase.				
	Maintenance and support may be needed for a longer time for large systems and for a short time for smaller systems.				
Life (	Cycle of System Analysis and Design				

The following diagram shows the complete life cycle of the system during analysis and

design phase.

## Role of System Analyst

The system analyst is a person who is thoroughly aware of the system and guides the system development project by giving proper directions. He is an expert having technical and interpersonal skills to carry out development tasks required at each phase.

He pursues to match the objectives of information system with the organization goal.

#### **Main Roles**

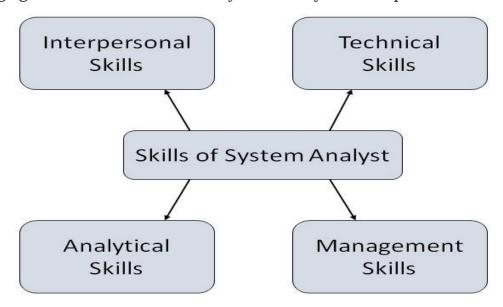

- □ Defining and understanding the requirement of user through various Fact-finding techniques.
- ☐ Prioritizing the requirements by obtaining user consensus.
- ☐ Gathering the facts or information and acquires the opinions of users.
- ☐ Maintains analysis and evaluation to arrive at appropriate system which is more user friendly.
- □ Suggests many flexible alternative solutions, pick the best solution, and quantify cost and benefits.

Draw	certain	specifications	which	are	easily	understood	by	users	and
progra	mmer in	precise and det	tailed fo	rm.	J				

- ☐ Implemented the logical design of system which must be modular.
- □ Plan the periodicity for evaluation after it has been used for some time, and modify the system as needed.

## **Attributes of a Systems Analyst**

The following figure shows the attributes a systems analyst should possess:

#### **Interpersonal Skills**

- ☐ Interface with users and programmer.
- ☐ Facilitate groups and lead smaller teams.
- Managing expectations.
- ☐ Good understanding, communication, selling and teaching abilities.
- ☐ Motivator having the confidence to solve queries.

# **Analytical Skills**

- ☐ System study and organizational knowledge
- □ Problem identification, problem analysis, and problem solving
- □ Sound commonsense
- ☐ Ability to access trade-off
- ☐ Curiosity to learn about new organization

#### **Management Skills**

	Understand users' jargon and practices.					
	Resource &project management					
	Change & risk management					
	Understand the management functions thoroughly.					
	tical Skills					
	Knowledge of computers and software					
	Keep abreast of modern development.					
	Know of system design tools.					
	Breadth knowledge about new technologies.					
Sum	umary					
An e	effective System Development Life Cycle (SDLC) should result in a high-quality system					
that	meets customer expectations, reaches completion within time and cost evaluations, and					
worl	ss effectively and efficiently in the current and planned Information Technology					
infra	astructure.					
Syst	em Development Life Cycle (SDLC) is a conceptual model which includes policies and					
proc	edures for developing or altering systems throughout their life cycles. SDLC is used by					
analysts to develop an information system. SDLC includes the following activities:						
	Requirements					
	Design					
	Implementation					
	Testing					
	Deployment					
	Operations					
	Maintenance
